The George Washington University

Department of Statistics

STAT 4197/6197 - Fall 2019

Week 15 - December 6, 2019

Major Topic: SASPy and Selected Python Applications

Detailed Topics:

- 1) SASpy Applications
- 2) Table Lookup Techniques
- 3) Best Practices in SAS Programming
- 4) Errors and Warnings in SAS Log
- 5) Efficiency in SAS Programming
- 6) Review for Final Exam

Introduction

There is often a need to combine or look up data from multiple sources to create meaningful reports.

Sas -

Introduction

When data sources do not share a common structure, a lookup table can match them.

Lookup Table Data

You can use several techniques to look up data.

Continent ID	Continent Name
91	North America
93	Europe
94	Africa
95	Asia
96	Australia/Pacific

IF-THEN/ELSE Statements

Lookup tables can be SAS programming statements.

```
data countryinfo;
    set orion.country;
    if ContinentID=91
        then Continent='North America';
    else if ContinentID=93
        then Continent='Europe';
    else if ContinentID=94
        then Continent='Africa';
    else if ContinentID=95
        then Continent='Asia';
    else if ContinentID=96
        then Continent='Australia/Pacific';
run;
```

7

Sas Man

DATA Step Merge

Lookup tables can be SAS data sets that are accessed during a DATA step merge.

PROC SQL Join

Lookup tables can be SAS data sets that are accessed during a PROC SQL join.

```
proc sql;
    create table countryinfo as
        select * from
            orion.country a, orion.Continent b
            where a.ContinentID=b.ContinentID;
quit;
```

9

Sas Man

User-Defined Formats

Lookup tables can be user-defined formats that are accessed with a FORMAT statement or PUT function

```
proc format;
    value ContName
        91='North America' 93='Europe'
        94='Africa' 95='Asia'
        96='Australia/Pacific';
run;

proc print data=orion.country;
    format ContinentID ContName.;
run;

data countryinfo;
    set orion.country;
    Continent=put(ContinentID,ContName.);
run;
```

10

Arrays

Lookup tables can be arrays.

11

Sas Man

Table Lookup Techniques

The technique that is used to perform a table lookup depends on the data.

Table Location	Technique	Lookup Table
DATA step	IF-THEN/ELSE statements	SAS programming statements
Disk	SQL join merge SET/SET KEY=	SAS data set
Memory	FORMAT statement PUT statement PUT function	user-defined format
	array reference	array
	FIND method	hash object

12

Reviewing SAS Arrays

An array is declared with an ARRAY statement. Array elements can be SAS variables or temporary data elements.

```
array ContName{91:96} $ 30 _temporary_
('North America',
'',
'Europe',
'Africa',
'Asia',
'Australia/Pacific');

ARRAY array-name {number-of-elements} <$> <length>
<_temporary_> <list-of-variables> <(initial-values)>;
```

24

Ssas Man

Reviewing SAS Arrays

This ARRAY statement assigns an initial value to each corresponding element. SAS matches the elements and values by position, so the values must be listed in the order of the array elements.

```
array ContName{91:96} $ 30 _temporary_
('North America',
''Europe',
'Africa',
'Asia',
'Australia/Pacific');

ContHume [92]
ContHume [92]
ContHume [92]
ContHume [92]
ContHume [92]
ContHume [92]
ContHume [93]
ContHume [93]
ContHume [93]
ContHume [94]
ContHume [94]
ContHume [95]
ContHume [95]
ContHume [96]
ContH
```

25

...

Reviewing SAS Arrays

When an initial value list is specified, all array elements behave as if they were named in a RETAIN statement.

```
array ContName {91:96} $ 30 _temporary_
('North America',
''surope',
'Africa',
'Asia',
'Asia',
'Australia/Pacific');
```

Example: Looking Up Continent Names Using an Array

A one-dimensional array can serve as a lookup table with the names of the continents.

Partial orion.country

	Country	Country Name	Population	ContinentID	
	AU	Australia	20,000,000	96	
	CA	Canada		91	
	DE	Germany	80,000,000	93	
	IL	Israel	5,000,000	95	
	TR	Turkey	70,000,000	95)	
Contrague 921 Contrague 921 Contrague 931 Contrague 941 Contrague 961					
North An		Europe

Example: Looking Up Continent Names Using an Array

Using a Table Lookup

Combine the data with a table lookup.

Partial orion.salarystats

Statistic	Yr1978 Yr1979		Yr1980
MedianSalary	fedianSalary 30025		30020
StdSalary	28551.9	9918.35	22356.91
SumSalary	mSalary 2393860		235030
AvgSalary 39243.61		33037.5	39171.67

Partial orion.employeepayroll

YEAR(S	SAS-date-	value)
--------	-----------	--------

EmployeeID	Salary	BirthDate	EmployeeHireDate
120101	163040	18AUG1980	01JUL2007
120102	108255	11AUG1973	01JUN1993
120103	87975	22JAN1953	01JAN1978
120104	46230	11MAY1958	01JAN1985
120105	27110	21DEC1978	01MAY2003
